Hydrocarbon Traps.

Hydrocarbon traps form where permeable reservoir rocks (carbonates, sandstones) are covered by rocks with low permeability (caprocks) that are capable of preventing the hydrocarbons from further upward migration. Typical caprocks are compacted shales, evaporites, and tightly cemented sandstones and carbonate rocks.

In a hydrostatic environment, the free-water level of a trap is horizontal. In a hydrodynamic environment, the free-water level of a trap is tilted because the buoyant force ( $P_b$ ) is interfered with by the hydrodynamic force ( $P_w$ ). The resultant interference is the vector known as the confining force ( $P_{cf}$ ).  $U$ , an equipotential line, is perpendicular to  $P_{cf}$  and is tilted because of the effect
